Contraceptive Advice Following Sugammadex

During many surgeries it is necessary to administer medication to relax your muscles. Prior to waking you up it is important to reverse the effects of these medications with “reversal” drugs. You received one of these “reversal” drugs called sugammadex (Bridion®).
Sugammadex can interfere with hormone-based contraception, reducing the effectiveness and increasing the chance of an unplanned pregnancy.

Oral Contraception

If you use oral contraception you should follow the “missed pill” advice in the package insert. Keep taking your pill.

Hormone-based, non-oral contraception

If you use any hormone-based contraception other than a pill; such as an implant, injection, intra-uterine system (doesn’t include the copper coil) or vaginal ring; you should use barrier contraception (condom/diaphragm) for 7 days.

If you have any questions or concerns your GP or pharmacist can help. Show them this letter. They can find advice on sugammadex in the British National Formulary (BNF).

Key Points

- You received a drug called sugammadex which can interfere with hormone-based contraception
- For oral contraceptives follow the missed pill advice in the package insert
- For non-oral contraception use a barrier method (such as a condom/diaphragm) for 7 days
